ABSTRACT

The Savings Goal Planning and Financial Progress Tracking System is a software application designed to help users effectively manage their personal finances by setting savings goals and tracking their progress over time. In many cases, individuals find it difficult to save money due to lack of proper planning and monitoring, which can lead to poor financial management. This project aims to simplify the process of saving money by providing a structured and automated system for goal setting and financial tracking.

The system allows users to define specific savings goals, such as purchasing a mobile phone, funding education, or planning a trip, along with a target amount and time period. Users can record their income and expenses regularly, and the system automatically calculates the total savings and remaining amount needed to achieve the goal. It also displays the progress in terms of percentage, helping users clearly understand their financial status.

The application is developed using programming concepts such as classes, objects, methods, conditional statements, and loops. It can be implemented as a console-based application or with a graphical user interface using technologies like Java or Python. The system ensures accurate calculations and organized data management, reducing manual effort and errors.

The main objective of this project is to encourage disciplined saving habits, improve financial awareness, and assist users in achieving their financial goals efficiently. The system provides a clear summary of savings, expenses, and progress, making it easier for users to plan and manage their finances.

This project demonstrates the practical application of programming concepts in solving real-world financial problems and serves as a foundation for developing more advanced financial management systems in the future

1. INTRODUCTION

In today's fast-paced world, managing personal finances has become increasingly important, especially for students and individuals who wish to achieve specific financial goals. However, many people struggle with saving money due to a lack of proper planning, monitoring, and financial awareness. Traditional methods of saving, such as maintaining handwritten records or relying on memory, are often inefficient and can lead to poor financial decisions, miscalculations, and lack of consistency.

With the growth of digital technology, automated financial tracking systems have become essential tools for improving money management. A computerized system helps users systematically plan their savings, monitor income and expenses, and evaluate their progress toward achieving financial goals. Such systems reduce manual effort and provide accurate and organized financial information.

The Savings Goal Planning and Financial Progress Tracking System is a software application designed to assist users in setting financial goals and tracking their savings effectively. The system allows users to define a goal amount, set a time period, and regularly update their income and expenses. Based on the data entered, the application automatically calculates the total savings, remaining amount, and percentage of progress toward the goal.

This project is developed using programming concepts such as classes, objects, methods, conditional statements, loops, and basic data handling techniques. It can be implemented either as a console-based application or with a graphical user interface using technologies like Java or Python.

The main objective of this system is to promote better financial planning, encourage disciplined saving habits, and help users achieve their goals efficiently. This project also demonstrates how programming concepts can be applied to solve real-life financial management problems and serves as a foundation for developing more advanced financial applications in the future

1.1 Objective

The main objective of the Savings Goal Planning and Financial Progress Tracking System is to develop a simple and efficient application that helps users plan their savings goals and track their financial progress using programming concepts.

The specific objectives of this project are:

- To design and develop a savings goal planning system using programming (Java/Python).
- To help users set financial goals with a target amount and time period.
- To record and manage user income and expenses systematically.
- To automatically calculate total savings and remaining amount.
- To track and display the progress of savings in percentage form.
- To reduce manual errors in financial calculations and tracking.
- To provide a user-friendly system for easy financial management.

- To demonstrate the implementation of programming concepts such as classes, objects, methods, loops, and conditional statements.
- To generate a clear summary of financial data including savings, expenses, and progress.

1.2 Overview

The Savings Goal Planning and Financial Progress Tracking System is a menu-driven application developed using programming languages such as Java or Python. The system provides a digital platform where users can set their financial goals and track their savings progress in an organized manner.

The system allows users to define a savings goal by entering the target amount and the time period to achieve it. It also provides options for users to record their income and expenses regularly. Based on the entered data, the system automatically calculates the total savings, remaining amount, and overall progress toward the goal.

The application displays financial details in a structured format, helping users clearly understand their spending habits and savings performance. It eliminates the need for manual calculations and reduces the chances of errors in financial tracking.

The system can be implemented as a console-based application or as a graphical user interface for better user interaction. It is designed to be simple, user-friendly, and efficient for personal financial management.

This project demonstrates the practical application of programming concepts in solving real-life problems related to financial planning and serves as a useful tool for individuals who want to improve their saving habits and achieve their financial goals.

1.3 Features

The Savings Goal Planning and Financial Progress Tracking System includes the following main features:

• **Goal Setting** – Allows users to set a savings goal by entering the target amount and time period to achieve it.

• **Income Recording** – Enables users to add and manage their income details such as salary, pocket money, or other earnings.

• **Expense Tracking** – Allows users to record daily expenses such as food, travel, shopping, and other costs.

• **Automatic Savings Calculation** – Automatically calculates total savings by subtracting expenses from income.

• **Progress Tracking** – Displays the progress of savings in percentage form based on the goal amount.

• **Remaining Amount Display** – Shows the remaining amount required to achieve the savings goal.

• **Summary Report Generation** – Generates a clear summary of financial details including income, expenses, savings, and progress.

• **User-Friendly Interface** – Provides a simple and easy-to-use menu-driven system for users.

• **Error Reduction** – Minimizes manual calculation errors through automated processing.

• **Efficient Financial Management** – Helps users manage money effectively and achieve their financial goals faster.

2 PROGRAM ANALYSIS

Program analysis is an important phase in software development where the problem is studied in detail and the requirements of the system are clearly identified. This stage helps in understanding how the system should function and what features are necessary to solve the problem effectively.

In the context of financial management, many individuals face difficulties in saving money due to lack of proper planning and tracking. Existing methods, such as maintaining manual records or relying on memory, are often inefficient and may lead to miscalculations, overspending, and poor financial decisions. There is no proper system to monitor income, expenses, and savings progress in a structured way.

The analysis phase focuses on identifying these issues in the current system and proposing a computerized solution that improves accuracy, efficiency, and ease of use. The proposed Savings Goal Planning and Financial Progress Tracking System is designed to help users set financial goals, record income and expenses, and automatically track their savings progress.

By analyzing user needs, the system is designed to include features such as goal setting, automatic calculations, progress tracking, and summary reporting. This ensures that users can manage their finances more effectively and achieve their financial goals in a planned and organized manner.

.

2.1 Problem Definition

In today's world, many individuals face difficulties in managing their personal finances effectively. Most people do not have a proper system to plan their savings or track their income and expenses. Traditional methods such as maintaining handwritten records or relying on memory often create several challenges.

Some common problems include:
- Lack of proper savings planning
- Difficulty in tracking income and expenses
- Errors in manual calculations
- Overspending due to poor financial monitoring
- No clear visibility of savings progress
- Difficulty in achieving financial goals within a time period

Manual methods of financial management are time-consuming and inefficient. They also make it difficult for users to analyze their financial status and take better decisions. As a result, many individuals fail to achieve their savings goals and face financial instability.

Therefore, there is a need for an automated system that can help users plan their savings, track financial activities, and monitor their progress efficiently.

The Savings Goal Planning and Financial Progress Tracking System is designed to solve these problems by providing a computerized solution that allows users to manage their finances in a simple, accurate, and organized manner.

2.2 Project Overview

The Savings Goal Planning and Financial Progress Tracking System is a software application developed to help users manage their personal finances in an efficient and organized manner. The system focuses on enabling users to set savings goals and monitor their financial progress over time.

The system provides a menu-driven interface where users can enter their financial details such as income and expenses. Users can also define a savings goal by specifying the target amount and the time period required to

achieve it. Based on the data entered, the system automatically calculates total savings, remaining amount, and progress percentage.

The system includes the following functionalities:
• Setting savings goals with target amount and duration
• Recording user income and expenses
• Automatically calculating total savings
• Tracking progress toward the savings goal
• Displaying remaining amount to achieve the goal
• Generating a summary of financial status

This project is implemented using programming concepts such as classes, objects, methods, loops, and conditional statements. It can be developed as either a console-based application or a graphical user interface using technologies like Java or Python.

The system simplifies financial management by reducing manual effort and providing accurate calculations. It helps users stay aware of their financial condition and supports them in achieving their savings goals effectively.

2.3 Scopes and Limitations

Scope

The scope of the Savings Goal Planning and Financial Progress Tracking System includes the following:

• Managing user savings goals with target amount and time period
• Recording and tracking income details
• Monitoring daily expenses in an organized manner
• Automatically calculating total savings and remaining amount
• Displaying progress toward the goal in percentage form
• Generating a summary report of financial activities
• Demonstrating the practical use of programming concepts

The system can be used by:

• Students managing pocket money and savings
• Individuals planning personal financial goals
• Families tracking household expenses
• Small-scale users who want simple financial management
• Anyone interested in improving saving habits and financial discipline

Limitations

The scope of the Savings Goal Planning and Financial Progress Tracking System includes the following:

• Managing user savings goals with target amount and time period
• Recording and tracking income details
• Monitoring daily expenses in an organized manner
• Automatically calculating total savings and remaining amount
• Displaying progress toward the goal in percentage form
• Generating a summary report of financial activities
• Demonstrating the practical use of programming concepts

The system can be used by:

• Students managing pocket money and savings
• Individuals planning personal financial goals
• Families tracking household expenses
• Small-scale users who want simple financial management
• Anyone interested in improving saving habits and financial discipline

3.SYSTEM DESIGN

System design is the stage where the structure and components of the system are planned before the actual implementation. In this phase, the system is divided into different modules, and the workflow of the application is clearly defined. Proper system design helps in organizing the program efficiently and makes the development process easier and more systematic.

The Savings Goal Planning and Financial Progress Tracking System is designed as a menu-driven application where users can set savings goals, record income and expenses, and track their financial progress automatically. The system processes user inputs and provides accurate calculations along with a clear summary of financial data.

The system is divided into several modules to perform specific tasks. Each module is responsible for handling a particular function of the system, ensuring better organization and smooth execution of the application.

The main modules of the system include goal setting, income management, expense tracking, savings calculation, and progress monitoring. These modules work together to provide a complete solution for personal financial management and help users achieve their savings goals efficiently**.**

3.1 Modules

The main modules of the **Hotel & Restaurant Billing System** are explained below:

1. Menu Display Module

This module is responsible for displaying and managing the user's savings goals along with their target amount and time period. It helps the user clearly define what they want to achieve financially.

The system allows the user to enter details such as the goal name, target amount, and duration. This information is stored and used throughout the program to track progress.

Example Goal:

1. Buy Mobile ₹20,000 (5 months)
2. Laptop Purchase ₹50,000 (10 months)
3. Trip Planning ₹15,000 (3 months)
4. Education Fund ₹30,000 (8 months)
5. Emergency Savings ₹10,000 (4 months)

The goal details are displayed when the program starts so that the user can easily view and understand their financial targets. This module forms the base for tracking savings and progress in the system.

2. Income and Expense Entry Module

This module allows the user to select food items from the menu and enter the quantity ordered by the customer. Functions of this module include: • Accepting user input for item selection• Accepting quantity of selected items• Storing order details temporarily The system allows users to select multiple food items before generating the final bill.2. Order Selection Module This module allows the user to select food items from the menu and enter the quantity ordered by the customer. Functions of this module include: • Accepting user input for item selection• Accepting quantity of selected items• Storing order details temporarily The system allows users to

select multiple food items before generating the final bill.2. Order Selection Module This module allows the user to select food items from the menu and enter the quantity ordered by the customer.

3. Bill Calculation Module

This module is responsible for calculating the total savings of the user based on the income and expenses entered. It helps in determining how much money the user has saved.

Functions of this module include:
- Calculating total income
- Calculating total expenses
- Computing savings using the formula (Savings = Income – Expenses)
- Storing calculated savings value

The system automatically calculates the total savings after multiple income and expense records are entered and prepares the data for generating the final financial summary.

4. Invoice Generation Module

This module generates the final financial report for the user. It provides a clear summary of savings and financial progress.

The report includes:
- Goal name
- Target amount
- Total income
- Total expenses
- Savings amount
- Remaining amount
- Progress percentage

Example Output:

------ SAVINGS REPORT ------
Goal: Buy Mobile

Item Amount
Income ₹15,000
Expenses ₹5,000

Savings ₹10,000
Remaining ₹10,000
Progress 50%

Keep Saving!

5. Exit Module

This module allows the user to exit the application safely after completing the financial tracking process.

When the user selects the exit option, the system terminates the program after ensuring that all entered data and calculations are completed.

This module ensures smooth and proper closure of the application without affecting the stored data.

4 METHODOLOGY

Savings Goal Planning and Financial Progress Tracking System

Methodology describes the process followed to develop the project. It explains the steps taken from understanding the problem to designing, implementing, testing, and documenting the system.

For the Savings Goal Planning and Financial Progress Tracking System, a structured development approach was followed to ensure that the system meets user requirements and functions efficiently.

The development process includes the following stages:

- Problem Analysis
- System Design
- Program Development
- Testing and Validation
- Result and Documentation

4.1. Problem Analysis

In this phase, the problem is studied and analyzed in detail. The requirements of the system are identified based on the needs of personal financial management.

The main problems identified in traditional financial tracking methods are:

- Manual calculations may lead to errors in savings and expense tracking.
- Managing income and expenses manually is time-consuming.
- Difficulty in tracking multiple financial entries efficiently.
- Lack of proper records for income, expenses, and savings progress.
- No clear visibility of progress toward achieving financial goals.

Based on these problems, the system requirements were defined to develop an automated application that simplifies savings planning and financial progress tracking.

4.2. System Design

In this stage, the overall structure of the system is designed before coding begins.

The system is divided into modules such as:

- Goal Setting Module
- Income and Expense Entry Module
- Savings Calculation Module
- Progress Tracking Module
- Summary Report Module
- Exit Module

The program flow and structure are designed in such a way that users can easily interact with the system and manage their financial activities efficiently.

4.3. Program Development

After designing the system, the program is implemented using a programming language such as Java or Python.

The following steps were followed during development:
- Creation of classes and methods for different modules
- Implementation of menu-driven logic
- Writing code for income and expense handling
- Developing logic for savings calculation
- Implementing progress tracking functionality
- Handling user input
- Displaying the final financial summary

Core programming concepts such as classes, objects, loops, conditional statements, and methods were used during development.

4.4. Testing and Validation

Testing ensures that the program works correctly and produces the expected results.

Different test cases were used to check the functionality of the system.

Example Test Cases:

Test Case	Input	Expected Result
Test Case 1	Goal = ₹10,000, Income = ₹5,000, Expenses = ₹2,000	Savings = ₹3,000, Progress = 30%
Test Case 2	Goal = ₹20,000, Income = ₹15,000, Expenses = ₹5,000	Savings = ₹10,000, Progress = 50%
Test Case 3	Goal = ₹15,000, Income = ₹8,000, Expenses = ₹3,000	Savings = ₹5,000, Remaining = ₹10,000
Test Case 4	Goal = ₹5,000, Income = ₹5,000, Expenses = ₹0	Savings = ₹5,000, Progress = 100%
Test Case 5	Goal = ₹12,000, Income = ₹6,000, Expenses = ₹2,000	Savings = ₹4,000, Progress = 33.33%

This phase ensures that the program runs without errors and produces accurate results.

4.5. Result and Documentation

After successful testing, the results of the system are documented. The system generates the final financial summary based on the user's savings goal, income, and expenses.

The results are demonstrated through program execution and screenshots showing the input and output of the system. The output includes details such as total income, total expenses, savings amount, remaining amount, and progress percentage.

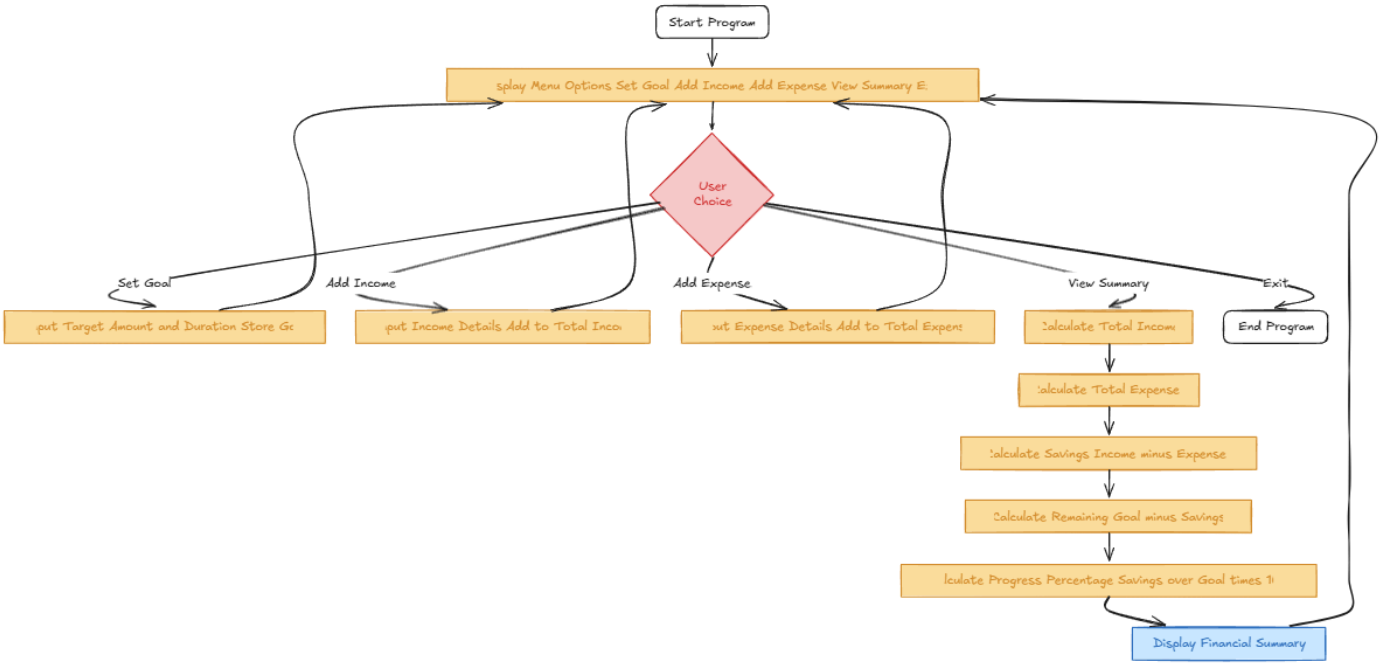
Proper documentation is prepared to explain the design, implementation, and working of the system. This documentation helps in understanding how the application functions and how it can be used effectively for financial planning and tracking.

4.6. Algorithm

Algorithm for the Savings Goal Planning and Financial Progress Tracking System

1. Start the program.
2. Display the menu options (Set Goal, Add Income, Add Expense, View Summary, Exit).
3. Ask the user to set a savings goal (target amount and duration).
4. Enter the income details.
5. Enter the expense details.
6. Calculate the total income.
7. Calculate the total expenses.
8. Calculate the savings using the formula (Savings = Income – Expenses).
9. Calculate the remaining amount (Goal – Savings).
10. Calculate the progress percentage (Savings / Goal × 100).
11. Display the final financial summary to the user.
12. Repeat steps if the user wants to update data.
13. End the program.

4.7. Flowchart



5.SCOUCE CODE

```
import java.util.Scanner;

class SavingsSystem {

   public static void main(String[] args) {

      Scanner sc = new Scanner(System.in);

      double goalAmount = 0;
      double totalIncome = 0;
      double totalExpense = 0;
      int choice;

      do {
```

```
System.out.println("\n------ SAVINGS SYSTEM ------");
System.out.println("1. Set Savings Goal");
System.out.println("2. Add Income");
System.out.println("3. Add Expense");
System.out.println("4. View Summary");
System.out.println("5. Exit");
System.out.print("Enter your choice: ");

choice = sc.nextInt();

switch (choice) {

    case 1:
        System.out.print("Enter Goal Amount: ₹");
        goalAmount = sc.nextDouble();
        break;

    case 2:
        System.out.print("Enter Income Amount: ₹");
        double income = sc.nextDouble();
        totalIncome += income;
        break;

    case 3:
        System.out.print("Enter Expense Amount: ₹");
        double expense = sc.nextDouble();
        totalExpense += expense;
        break;

    case 4:
```

```
            double savings = totalIncome - totalExpense;
            double remaining = goalAmount - savings;
            double progress = 0;

            if (goalAmount > 0) {
                progress = (savings / goalAmount) * 100;
            }

            System.out.println("\n------ SAVINGS REPORT ------");
            System.out.println("Goal Amount: ₹" + goalAmount);
            System.out.println("Total Income: ₹" + totalIncome);
            System.out.println("Total Expense: ₹" + totalExpense);
            System.out.println("Savings: ₹" + savings);
            System.out.println("Remaining: ₹" + remaining);
            System.out.println("Progress: " + progress + "%");
            break;

        case 5:
            System.out.println("Thank You! Exiting...");
            break;

        default:
            System.out.println("Invalid Choice!");
        }

    } while (choice != 5);

    sc.close();
  }
}
```

Progress: 30.0%
```

7. DISCUSSION AND CONCLUSION

7.1 Discussion

The Savings Goal Planning and Financial Progress Tracking System was developed to help users manage their personal finances effectively. The system allows users to set savings goals, record income and expenses, and track their financial progress automatically.

During the development process, programming concepts such as loops, conditional statements, methods, and object-oriented principles were applied. The system successfully performs savings calculations and displays accurate financial summaries.

The system was tested with different inputs to ensure that it performs calculations correctly. The results show that the system reduces manual effort and helps users monitor their financial activities efficiently. It also improves financial awareness and encourages better saving habits.

7.2 Conclusion

The Savings Goal Planning and Financial Progress Tracking System successfully demonstrates the practical application of programming concepts in developing a real-world financial management application.

The system automates the process of tracking income, expenses, and savings, reducing calculation errors and saving time. It provides users with a clear understanding of their financial status and helps them achieve their savings goals more effectively.

This project helps students understand how programming can be used to solve real-life problems. The system can be further enhanced by adding features such as database integration, graphical user interfaces, mobile application support, and automated notifications for better financial management.
